Cover Letter - Unity Developer

Papaya's focus on skill-based mobile games, competition, and player experience is exactly the kind of product environment where my Unity background fits well. I have 4+ years of experience building and maintaining commercial mobile and cross-platform games, with hands-on work across Android and iOS.

Unity and C# have been central to my work across mobile projects, from building Android games from scratch to developing 2D iOS games and shipping an indie title to Google Play. I have worked with scalable architecture using Zenject and SOLID principles, reusable Core modules, and production tooling including UniTask, Addressables, and DOTween.

Performance Optimization has been a regular part of my development work. At QPLAZE, I used Unity Profiler and Frame Debugger to analyze CPU/GPU performance, optimize sprite atlases and draw calls, and reduce build sizes with Asset Bundles. At OpenSkies Games, I also worked on HLSL shaders and rendering optimization for URP projects.

I would bring the same practical approach to Papaya's mobile games: clean code, performance-focused development, reliable feature delivery, and attention to the player experience. I would be glad to contribute to a team building games for a global audience from your Warsaw office.

Best regards,

Maksym Khomiak
